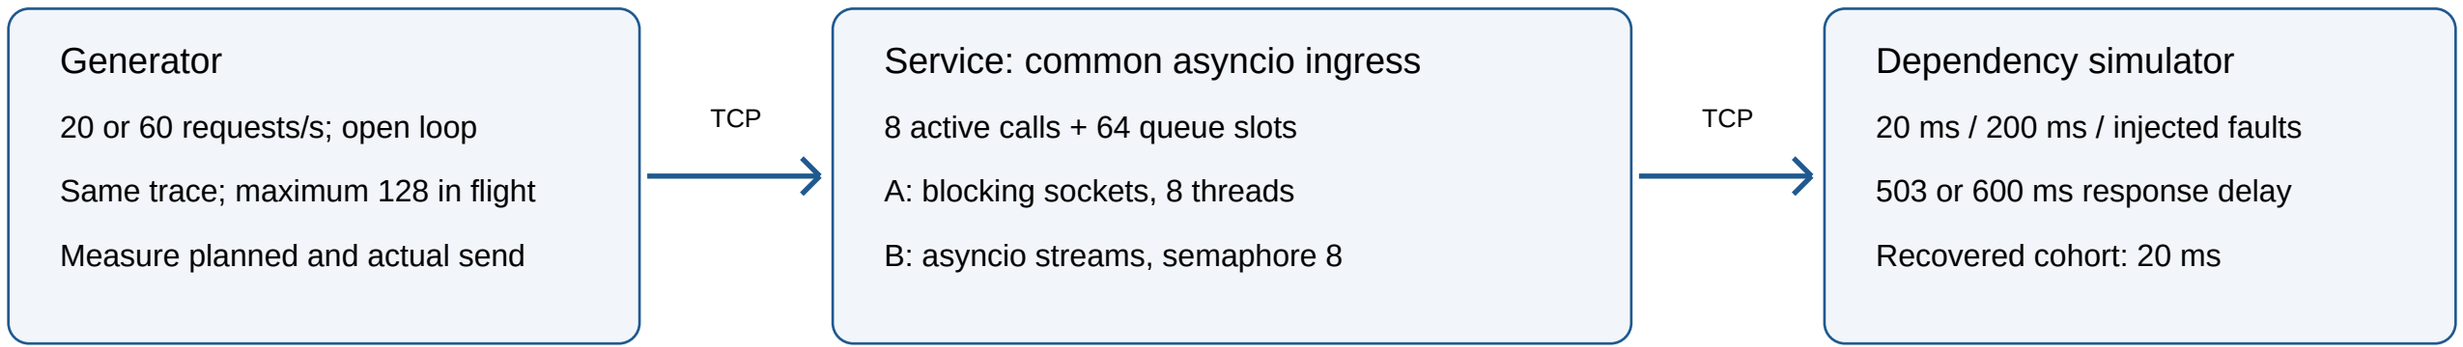
Local TCP experiment: three processes on one Windows computer

Per run: service and dependency restarted; generator process and event loop reused within the series.



New loopback connection per request; JSON/LF; no HTTP, TLS, retries, pooling, or circuit breaker.

300 ms deadline: sync starts inside blocking_rpc after thread dispatch; async starts on entry to the rpc timeout. Semaphore wait excluded. dependency_ms includes sync dispatch and socket closing; it is not the sleep duration. recovered is a new request cohort, not a global dependency recovery. asyncio is not Reactive Streams. generator_cpu_s also includes final control RPCs, sorting, validation and CSV writing.
